

DESIGN BRIEF

JM-Qafri Pharma Extension

A concise, hospital-toned product design brief for extending the current JM-Qafri site into a more structured pharmaceutical and care-delivery experience.

Pharma Experience

Telehealth Transition

Hospital Green Palette

Extension-Ready

Current site signal

Public-facing healthcare narrative

The current JM-Qafri pharma surface is positioned as a healthcare infrastructure and outreach story, with emphasis on accessibility, mobile clinics, partnerships, and technology-enabled care.

Extension opportunity

Operational pharmaceutical layer

The next step is to turn that narrative into a guided product flow: outreach, appointments, medication workflows, records, and role-based dashboards for care teams and administrators.

Prepared for JM-Qafri platform extension planning

Theme direction: clinical, calm, trustworthy green

1. SITE OVERVIEW

What the current site communicates

Based on the current codebase, the site functions as a broad JM-Qafri platform with a dedicated pharma section rather than a fully isolated medical product. The pharma area introduces healthcare initiatives and links users toward a deeper pharmaceutical application path.

Current public pharma story

- Healthcare infrastructure improvement across Africa
- Accessibility and underserved-community outreach
- Technology integration into care delivery
- Partnerships as a core delivery model
- Mobile clinic initiatives as a flagship concept

What the user-facing journey implies

- Landing pages establish trust and mission
- Pharma pages frame healthcare credibility
- Mobile clinic content hints at field operations
- External pharma app link suggests a deeper system layer
- Admin/Firebase foundations support future operational growth

The site already tells a strong healthcare mission story. The extension should convert that story into a clear pharmaceutical service experience.

Reading of current repo: public pharma pages plus broader platform infrastructure

Not yet a fully unified end-to-end medical product

2. TRANSITION

How the main site should transition into the pharmaceutical side

The transition should feel intentional and calm: from mission-led storytelling into care delivery, pharmaceutical services, and clinical operations. Instead of a hard handoff, the site should guide users through trust, services, intake, and access.

1

Mission to service

Start with the existing healthcare infrastructure message, then introduce concrete care services: teleconsultation, medicine access, mobile clinic support, prescription handling, and patient follow-up.

2

Service to guided action

Replace generic CTAs with clear next steps: Book Consultation, Request Medication Support, Find Mobile Clinic, Apply as Provider, and Access Patient Portal.

3

Guided action to role-based experience

After initial engagement, users move into tailored spaces: patient, clinician, pharmacist, operations/admin, or outreach representative.

4

Role-based experience to operational continuity

The extension becomes the system of action: appointments, supply coordination, prescription workflows, records, field outreach, and reporting.

Transition tone

Calm, reliable, medically grounded, and service-oriented. The shift should feel like entering

Navigation behavior

Keep top-level branding consistent, but tighten the information architecture once users enter pharma. Fewer

a trusted care environment, not switching to a different product.

promotional distractions, more task clarity.

3. EXTENSION STRUCTURE

Suggested pharmaceutical app architecture

This structure bridges the current public pages with the kind of telehealth and healthcare operations flow described in your product vision.

Public Pharma Landing

Awareness and trust entry point

Brief site explanation, service categories, mobile clinic story, hospital/pharmacy trust cues, and action-oriented entry points into the operational app.

Patient Portal

Care access and continuity

Profile, appointments, clinic requests, medication requests, prescription history, care team visibility, and medical-record review.

Doctor / Clinician Workspace

Care delivery interface

Consultation queue, appointment schedule, patient summaries, treatment notes, referrals, and follow-up management.

Pharmacy Operations

Medication and fulfillment layer

Prescription intake, stock awareness, dispensing workflow, substitution approvals, and medication-delivery coordination.

Admin & Outreach Dashboard

Oversight and field management

Patient volume, provider management, clinic requests, mobile-clinic deployment, outreach performance, and service analytics.

Primary goal

Move from awareness into usable healthcare actions.

Secondary goal

Unify telemedicine, clinic outreach, and pharma operations.

Key outcome

Create a believable continuum from public trust to real care delivery.

4. VISUAL DIRECTION

Hospital-green design system

The extension should move away from blue/indigo accents and use a cleaner, more clinical green language that signals health, safety, and confidence.

Design mood

- Bright, sterile, and reassuring rather than corporate-techy
- Soft greens and white surfaces with light grey separators
- More breathable spacing and fewer decorative distractions
- Clinical clarity over marketing density

Interface behavior

- Simple cards, clear section labels, consistent spacing
- Status indicators for appointments, prescriptions, and requests
- Friendly but professional iconography
- Accessible contrast and legible typography for medical data

Recommended visual shift from current pharma pages

Keep the current healthcare mission content, but swap indigo buttons and headline accents for clinical green, softer white panels, cleaner cards, and more structured healthcare navigation. This makes the extension feel closer to a hospital-grade product than a campaign microsite.

5. SUMMARY

Brief explanation you can reuse inside the app extension

JM-Qafri's current site presents the pharmaceutical side as part of a broader healthcare and infrastructure mission. It introduces users to healthcare accessibility, mobile clinic outreach, technology integration, and partnership-led delivery. The pharmaceutical extension should build on that foundation by turning the narrative into a practical care platform: patients can request care and medication support, clinicians can manage appointments and treatment actions, pharmacy teams can coordinate prescriptions and fulfillment, and administrators can oversee outreach, capacity, and service quality. Visually, the extension should move from blue-accented promotional styling into a hospital-green design system that feels clean, calm, trustworthy, and medically credible.

Immediate design recommendation

Build the pharma extension as a dedicated, role-aware experience that still feels connected to the main JM-Qafri brand.

Immediate product recommendation

Make the first release revolve around care access, medication flow, mobile clinic coordination, and dashboard clarity.
